## ADVANCE GOLD INTERSECTS 240G/T SILVER OVER 2.30M IN HOLE 18 AND 383G/T SILVER OVER 0.80M IN HOLE 19 AT TABASQUENA

Advance Gold Corp. (TSXV: AAX) (“Advance Gold” or “the Company”) is pleased to report drilling results from ongoing drilling at its 100% owned Tabasquena project in Zacatecas, Mexico. The results are from the company’s flagship property that is investigating a 3500m long continuous high chargeability Induced Polarization (IP) anomaly.

Allan Barry Laboucan, President and CEO of Advance Gold Corp. commented: *“Three holes were completed near hole AGT-15 which previously reported a high-grade hit of 2.15m of 664.g/t silver. The most recent holes in the southern domain of the claims appear to extend the mineralization in veins to over 1000 metres. At the nearby MAG Silver mine, the highest grades were intersected several hundred metres deeper than where we have drilled the veins at Tabasquena. Our next focus will be to drill significantly deeper to test this depth potential, with drilling to begin shortly.”*

*The intervals indicated are drill intersections as there is not enough information at this time to define true widths of the mineralization.*

# Cross Section

Drill core is logged and sampled in a secure core storage facility located near the Tabasquena claims at Ojocaliente, Mexico. Core samples from the drill holes are cut in half, using a diamond cutting saw, and sent to SGS Minerals in Durango, Mexico, for sample preparation and assaying. The Company relies on SGS Minerals for QA/QC procedures. All samples are analysed for gold using standard fire assay-AA (atomic absorption) techniques and ICP for all other metals.
